

AKHIL PRASENAN

Lead Software Engineer • Platform & AI Infrastructure • Singapore PR

prasananakhil@gmail.com • +65 8328 6347 • linkedin.com/in/akhilprasanan

PROFILE

Engineering lead with 9+ years building and running enterprise platforms on Google Cloud, the last six embedded with Google through JLL. I own the architecture, the CI/CD pipelines, and the containerized deployment (Docker on Cloud Run and Cloud Functions) of a platform used by Google project teams in the US, Europe, and APAC, and I lead a distributed team of four engineers across Singapore and Poland. My recent work is AI platform infrastructure: RAG pipelines on Vertex AI that keep a knowledge base current without manual steps and ground LLM output for Q&A and automated executive summaries. I would rather build a paved road the whole team can use than another one-off fix. Looking for a Principal or Lead platform role where I can own the technical direction and help engineering teams adopt AI tooling responsibly.

TECHNICAL SKILLS

- **Platform & infrastructure:** Google Cloud Platform (Cloud Run, Cloud Functions, Cloud Storage, Cloud Logging), Docker and containerized deployment, CI/CD pipeline design and ownership, deployment safety, production troubleshooting and incident resolution, Terraform (working knowledge)
- **AI platform / data:** RAG pipeline design and implementation: Vertex AI, vector databases, embeddings and retrieval, LLM grounding for Q&A and summary generation, automated ingestion with Cloud Functions and Cloud Storage
- **Languages & frameworks:** Python, Go, TypeScript, JavaScript, Node.js, Angular, React, HTML, CSS/SASS
- **Test automation:** End-to-end browser test automation with Selenium
- **Architecture:** System and platform architecture for enterprise products, reusable component and design systems, performance engineering for large datasets, platform modernization and end-of-life migration
- **Leadership:** Distributed team leadership, hiring and onboarding, mentoring, Agile delivery, stakeholder management across US, Europe, and APAC

EXPERIENCE

Jones Lang LaSalle (JLL), Singapore • *Embedded team delivering software for Google* May 2020 – Present
Six years on the same Google account, promoted twice, from senior engineer to owning the platform's architecture, deployment infrastructure, and team.

Lead Software Engineer (P4)

Mar 2025 – Present

- Own the CI/CD pipelines and deployment workflow for an enterprise platform that serves Google project teams in the US, Europe, and APAC. Docker images ship to Google Cloud Run and Cloud Functions through pipelines I designed, which improved release reliability and developer efficiency.
- Designed the RAG ingestion pipeline that keeps the knowledge base current with zero manual steps: planning documents and data-transformation logic dropped into a Cloud Storage bucket are automatically embedded and indexed into a Vertex AI vector database via Cloud Functions.
- Built the Python backend that grounds Vertex AI on this corpus to answer user questions about the data and draft executive summaries comparing any two data versions, served to the frontend application.
- Building an AI-powered comparison tool (in active development) that analyzes monthly versions of real estate planning data, explains what changed and how it affects projections, and flags outliers that are likely data-entry mistakes, so data-quality issues get caught before decisions are made on them.
- Troubleshoot and resolve production issues using GCP Cloud Logging, and act as the escalation point for incidents on the platform.
- Led end-of-life planning and execution for retiring products, migrating users and data without breaking dependent systems.
- Own the frontend and system architecture of the platform; make the build-vs-refactor calls that keep it scalable and maintainable as the product changes.
- Lead a team of four engineers split between Singapore and Poland; run hiring, onboarding, and development for the team, and mentor engineers on architecture and problem-solving.
- Act as project manager for the account: planning, resourcing, execution, and delivery sit with me, alongside the technical work. Serve as the primary technical contact for Google stakeholders and influence engineering decisions beyond my immediate team.

Lead Software Engineer (P3)

Mar 2022 – Mar 2025

- Ran day-to-day development and Agile delivery for the platform team; planned the application architecture and set up the DevOps processes the team still runs on.
- Reviewed code across the team and mentored junior engineers, which raised the baseline of what shipped.
- Managed client communication and stakeholder expectations through several major deliveries.

Senior Frontend Engineer

May 2020 – Mar 2022

- Built data visualization dashboards that turned large operational datasets into views stakeholders actually used for decisions.
- Optimized frontend performance to handle large datasets without degrading the user experience.
- Redesigned user interaction flows, which improved usability and product adoption.

Ernst & Young, Singapore · Senior UI/UX Developer

May 2018 – Jul 2020

- Delivered large enterprise and government web platforms with heavy regulatory requirements.
- Wrote automated end-to-end browser tests with Selenium for these platforms.
- Designed the frontend architecture and reusable component systems used across projects, and wrote the shared frontend standards other teams built on.

Adelphi Digital, Singapore · UI/UX Developer

May 2017 – May 2018

- Built responsive production web applications with a focus on performance, accessibility, and cross-browser support.

EDUCATION

BSc (Honours) Computer Science - University of Portsmouth (Kaplan Singapore) · Completed Jan 2026

Completed part-time while working full-time as Lead Software Engineer.

Diploma in Aerospace Avionics - Republic Polytechnic, Singapore · 2010 – 2013

ADDITIONAL

- **Work authorization:** Singapore Permanent Resident; Indian citizen.
- **Languages:** English (fluent); Malayalam (native); Tamil (conversational).
